EDUCATION

McMaster University

Sept. 2024 – Apr. 2028 (Expected)

Bachelor of Applied Science (Honours), Computer Science Co-op — Dean's Honour List

EXPERIENCE

Software Developer Intern

May 2026 – Aug. 2026

VJS Systems Inc. — Client: Mansteel Limited

Hamilton, ON

- With no source code available, reverse-engineered 200+ screens of a client's 30-year-old DataFlex accounting system for steel fabrication and supply, translating ambiguous legacy behavior into plain-language client questions that drove implementation; verified via structured UAT.
- Rebuilt the core order-entry workflows (invoices, delivery slips, backorders, lot profiles) in React 19/TypeScript with live cross-document validation, surfacing linking errors, out-of-sequence shipments, and duplicate-invoice conflicts at entry time that the legacy DOS app deferred until save.
- Designed and shipped 114 REST endpoints across 20+ core modules in a Fastify/TypeScript API, extracting a 146-line route factory that generates full CRUD for 8 admin resources, and backed the API with 1200+ automated tests.
- Hardened concurrent write paths against race conditions inherited from the legacy system, applying table locks and atomic sequence generation across 9 write paths to prevent duplicate invoice and delivery-slip numbering under simultaneous entry.
- As the team's top contributor, owned code review for a teammate's entire output, fielding his design questions and escalating unresolved ones to our lead; authored the team's engineering process (Definition of Done, ClickUp task lifecycle) and a Figma wireframe for client sign-off.

Software Engineering Intern

Mar. 2026 – May 2026

EventSystemPro

Remote

- Modernized a 1M+ LOC legacy PHP event-management platform for PHP 8.x, upgrading core CMS, framework, and 200+ generated event-controller code paths across 4 production systems serving over 50,000 users.
- Cut CMS event-page load time by 94% (8s to 0.5s) by adding schema-aware MySQL indexes across core database tables using a safe PHP migration script with dry-run support.
- Hardened a legacy Stripe integration for PHP 8.x, adding checkout-locking safeguards to eliminate duplicate payments in the protected payment flow while extending promo-code support across payment and invoice workflows.
- Integrated an AI-assisted rich-text editor into legacy CMS workflows, cutting content-authoring time by over 80% in internal testing while upgrading outdated WYSIWYG editing paths.
- Led a 3-person engineering team, directing technical priorities and delegating CMS, payments, and event-controller workstreams; owned the git repository and served as the team's primary point of contact with leadership.

Full-Stack Software Developer

Jan. 2025 – May 2025

Finest Finish

Hamilton, ON

- Implemented regex input validation, cutting invalid form submissions by 85% and improving data reliability.
- Built a PHP and MySQL web application for a local furnishing business to track orders, costs, and revenue; reduced form submission latency by 80% (2.5s to 0.5s) via asynchronous JavaScript requests.

PROJECTS

MusiWrite | *Python, Flask, Spotify API, Ollama AI*

- Built a Flask application that translates free-form user text into Spotify playlists by extracting mood and scene attributes via LLM inference.
- Implemented local LLM inference using a quantized 7B model via Ollama, eliminating third-party API costs while preserving user data privacy through offline processing.
- Designed playlist aggregation logic using the Spotify Web API, combining tracks across multiple sources while enforcing mood consistency and avoiding repetition.

TECHNICAL SKILLS

Languages: Python, Java, JavaScript, TypeScript, SQL (MySQL, PostgreSQL), PHP, C

Web: React, Tailwind CSS, Flask, Node.js, Express.js, Fastify, Next.js, Three.js, Vitest, RESTful APIs

AI / NLP: OpenAI API, Anthropic API, Gemini API, Ollama, Hugging Face Transformers

Tools: Git, GitHub, GitHub Actions, Docker, Linux/UNIX, Apache, cPanel, Figma
